Static (or equilibrium) analysis; Comparative-static analysis; Optimization problems; Dynamic analysis; Mathematical programming and game theory.

In this text, Dr. Chiang introduces students to the most important methods of dynamic optimization used in economics. The classical calculus of variations, optimal control theory, and dynamic programming in its discrete form are explained in the usual Chiang fashion, with

patience and thoroughness. The economic examples, selected from both classical and recent literature, serve not only to illustrate applications of the mathematical methods, but also to provide a useful glimpse of the development of thinking in several areas of economics.

This book, first published in 1996, introduces students to optimization theory and its use in economics and allied disciplines. The first of its three parts examines the existence of solutions to optimization problems in R^n , and how these solutions may be identified. The second part explores how solutions to optimization problems change with changes in the underlying parameters, and the last part provides an extensive description of the fundamental principles of finite- and infinite-horizon dynamic programming. Each chapter contains a number of detailed examples explaining both the theory and its applications for first-year master's and graduate students. 'Cookbook' procedures are accompanied by a discussion of when such methods are guaranteed to be successful, and, equally importantly, when they could fail. Each result in the main body of the text is also accompanied by a complete proof. A preliminary chapter and three appendices are designed to keep the book mathematically self-contained.

It has been 20 years since the last edition of this classic text. Kevin Wainwright, a long time user of the text (British Columbia University and Simon Fraser University), has executed the perfect revision--he has updated examples, applications and theory without changing the elegant, precise presentation style of Alpha Chiang.

Mathematics for Economists, a new text for advanced undergraduate and beginning graduate students in economics, is a thoroughly modern treatment of the mathematics that underlies economic theory. An abundance of applications to current economic analysis, illustrative diagrams, thought-provoking exercises, careful proofs, and a flexible organisation-these are the advantages that Mathematics for Economists brings to today's classroom.

Alpha C Chiang, a renowned economist, and Professor Emeritus of Economics at the University of Connecticut, is best-known for his classic textbook — Fundamental Methods of Mathematical Economics. In this memoirs, he tells the entertaining, scary, embarrassing, glorifying and surreal tales that colored his life. On the academic side, Alpha describes in detail his scholastic journey, including why and how he created one of the most popular books on mathematical methods in economics, as well as the experiences of his teaching career. On the nonacademic side, he describes his ventures into his many hobbies, the spices of his life, including Chinese opera, ballroom dancing, painting and calligraphy, photography, piano, music composition, playwriting, and even magic. Such tales round out the depiction of a colorful life. What's behind his unusual name, Alpha? What schooling disaster tripped him at a young age? What surreal occurrence did he experience at a cliff at age 8? What major miracle changed his family? How did he become a loan shark when he was a graduate student at Columbia University? What Hollywood glamour star mysteriously materialized within inches of him when he was working on a TV show in his student days? How did he conquer a serious phobia and eventually become an acclaimed professor? What motivated his writing of his

celebrated book? And what funny, embarrassing, and memorable events occurred in his teaching career? This book is a unique story about a unique life.

A textbook for a first-year PhD course in mathematics for economists and a reference for graduate students in economics.
