Today, for patients of any age, a panoramic radiograph that allows high diagnostic reliability with minimum radiation exposure must be acknowledged as the standard of care. The new, more medically and legally responsible strategy for examination of patients is closely intertwined with a basic principle of patient care. Panoramic radiograph is rapidly becoming a meaningful and normal component of dental practice-oriented prevention. This Atlas presents the proper use of optimum radiographic exposure and contemporary techniques for today's dental office. Emphasis is placed on the reliable recognition of normal structures in the projected space and clear differentiation of normal features from pathological radiographic signs. These major topics of fundamental importance for correct interpretation are treated more extensively. The section on diagnosis deals in depth with the typical radiographic manifestations of frequently occurring pathological processes. Inherent in that section of the book is the basic understanding that the radiopathologic manifestation of one and the same lesion may vary considerably depending on the patient's age and sex, on the phase of development of the lesion at the time of documentation, on the localization within different surrounding structures, and according to actual histologic features of the lesion.

An illustrated guide for the complex process of orthodontic diagnostics and indication. The total process of treatment planning including the scientific bases is pictorially described. Beside the conventional methods of examination and model analysis, emphasis is placed on the crano-facial growth processes, the aetiology of malocclusions and on the importance of functional analysis. The following three aspects are described in detail in this book: Growth of the Facial Skeleton - types of treatment which promote or guide growth. In order to control these natural processes artificially, a precise understanding of them is required. Aetiology of the Malocclusion - the various types of causative therapy and the elimination of the causes. Functional Analysis - many malocclusions are a result of dysfunctions. As a variety of methods are available for treating dysfunctions, functional analysis is taken very seriously.
