Dynamic simulation (or dynamic system simulation) is the use of a computer program to model the time-varying behavior of a dynamical system. The systems are typically described by ordinary differential equations or partial differential equations. A simulation run solves the state-equation system to find the behavior of the state variables over a specified period of time.

Richard Bennett created the first system dynamics computer modeling language called SIMPLE (Simulation of Industrial Management Problems with Lots of Equations) in the spring of 1958. In 1959, Phyllis Fox and Alexander Pugh wrote the first version of DYNAMO (DYNAmic MOdels), an improved version of SIMPLE, and the system dynamics language became the industry standard for over thirty years.

Dynamic models provide one means of simulating the time-dependent behavior of systems. The defining feature of a dynamic model is that unlike the static model, it does maintain an internal 'memory' of some combination of prior inputs, internal variables, and outputs. The canonical example of a dynamic model involves the combination of algebraic ...

SD and DE are traditional, AB is relatively new. There is also Dynamic Systems (DS) field, but it stays a bit aside as it is used to

System dynamics is a highly abstract method of modeling. It ignores the fine details of a system, such as the individual properties of people, products, or events, and produces a general representation of a complex system. These abstract simulation models may be used for long-term, strategic modeling and simulation.
