They are interesting curves because they have discontinuities. For certain values of x , the tangent, cotangent, secant and cosecant curves are not defined, and so there is a gap in the curve. [For more on this topic, go to Continuous and Discontinuous Functions in an earlier chapter.] Recall from Trigonometric Functions, that

4. Graphs of tan, cot, sec and csc

You can graph a secant function $f(x) = \sec x$ by using steps similar to those for tangent and cotangent. As with tangent and cotangent, the graph of secant has asymptotes. This is because secant is defined as $\frac{1}{\cos x}$. The cosine graph crosses the x -axis on the interval

How to Graph a Secant Function - dummies

Just like the other two graphs, our cotangent graph has asymptotes wherever our tangent function is equal to 0. Our tangent function equals 0 every $\pi \cdot n$ spaces, so at 0, π , 2π , and so on. We see...

Graphing the Cosecant, Secant & Cotangent Functions ...

To graph secant and cosecant, find values of the reciprocal functions and plot them on the coordinate plane. Unlike the graphs of sine and cosine, secant and cosecant have vertical asymptotes whenever the cosine and sine equal zero, respectively.

Graphing the Cosecant, Secant & Cotangent Functions

Graphing One Period of a Shifted Tangent Function Now that we can graph a tangent function that is stretched or compressed, we will add a vertical and/or horizontal (or phase) shift. In this case, we add C

and D to the general form of the tangent function. $f(x) = A \tan(Bx + C) + D$

6.3: Graphs of the Other Trigonometric Functions ...

Graphing Variations of $y = \sec x$ and $y = \csc x$ For shifted, compressed, and/or stretched versions of the secant and cosecant functions, we can follow similar methods to those we used for tangent and cotangent. That is, we locate the vertical asymptotes and also evaluate the functions for a few points (specifically the local extrema).

How To Graph Tangent and Cotangent Functions With ...

Graphing Secant and Cosecant • Like the tangent and cotangent functions, amplitude does not play an important role for secant and cosecant functions. • Both have the same period of 2π , so we solve the phase shift and period with $Bx + C = 0$ & $Bx + C = 2\pi$

Tangent and Cotangent

From the graphs of the secant and cosecant functions, we see that secant is an even function (like cosine) and cosecant is an odd function (like sine). Also, the period of secant and cosecant are the same as the period of cosine and sine, which is 2π .

Cosecant and Secant Graphs | Brilliant Math & Science Wiki

We can get three more trigonometric functions by taking the reciprocals of three basic functions: sine, cosine and tangent. The secant function is the reciprocal of the cosine function. The abbreviation of secant is sec. The cosecant function is the reciprocal of the sine function.

Graphing Variations of $y = \tan x$ As with the sine and cosine functions, the tangent function can be described by a general equation. We can identify horizontal and vertical stretches and compressions using values of A and B . The horizontal stretch can typically be determined from the period of the graph.

Graphs of the Other Trigonometric Functions – Precalculus

If possible, use the graphing utility to draw the graphs of the vertical lines $x = -\frac{\pi}{2}$ and $x = \frac{\pi}{2}$. The graph of the function f has vertical asymptotes $x = -\frac{\pi}{2}$ and $x = \frac{\pi}{2}$. The reason for this is that at these values of x , the numerator of the function is not zero and the denominator is 0.

2.4: Graphs of the Other Trigonometric Functions ...

The cosecant and secant functions are closely tied to sine and cosine, because they're the respective reciprocals. In reference to the coordinate plane, cosecant is r / y , and secant is r / x . The value of r is the length of the hypotenuse of a right triangle — which is always positive and always greater than x and y .

Graph of the secant function Because the secant function is the reciprocal of the cosine function, it goes to infinity whenever the cosine function is zero. The derivative of $\sec(x)$ In calculus, the derivative of $\sec(x)$ is $\sec(x)\tan(x)$.
