SQL tuning involves three basic steps: Identifying high load or top SQL statements that are responsible for a large share of the application workload and system resources, by reviewing past SQL execution history available in the system. Verifying that the execution plans produced by the query optimizer for these statements perform reasonably.

~~SQL Tuning Overview - docs.oracle.com~~

Performance tuning in Oracle databases includes optimizing SQL statements and query execution plans so that the requests can be completed more efficiently. The organization of a database the SQL statements used to access that data, determine the level of resources needed to respond to queries when an application communicates with the database.
