"Design of pumps". Each liquid possesses diverse characteristics that may influence not only the choice of the pump, but also its configuration such as the type of the mechanical seal or the motor.

Fundamental characteristics in this respect are: •

Viscosity (friction losses)

• Corrodibility (corrosion)

• Abrasion • Temperature

(cavitation)

Pump Station Design  
Guidelines Second Edition  
Ideally, the flow of fluid into any pump should be uniform, steady, and free from swirl and entrained air. Lack of uniformity can cause a pump to operate at a lower efficiency. Unsteady flow causes the load on the impeller to fluctuate, which can lead to noise, vibration, and bearing problems. Swirl in the pump intake can cause a

Gear pumps are one of the most common types of positive displacement pump. They operate by an unchanging volume of fluid passing between the teeth of two meshing gears and their casing at a constant rate (not between the gears themselves). As the gears rotate and the meshed teeth separate, a partial vacuum is formed that fills with fluid.

A well-designed system – specifying a heat pump is more complex than specifying a gas boiler. Whereas you may over-specify the size of your gas boiler ‘just in case’, this is not a good idea when it comes to heat pumps. Over-sized systems are more expensive and one that is too big will

## Pump Sizing Calculation

A pump circulates water or a water and antifreeze solution through the heat pump water-to-refrigerant heat exchanger and the submerged piping loop which transfers heat to or from the body of water. Open-loop surface water heat pumps can use surface water bodies in a similar way that cooling towers are used, but without the fan energy and required maintenance.

## SECTION 5.21.30 - FIRE PUMPS DESIGN AND CONSTRUCTION STANDARD

Air source heat pumps use a small amount of electricity to power a fan which draws in latent heat from the air outside the home. This heat is then compressed to increase the temperature even further so it can be passed to a heat exchanger to heat water in a cylinder. This hot water can then supply your taps and radiators or underfloor heating.
